Everybody likes paying less tax, and several articles offer tax-saving strategies. One article provides strategies to minimize or avoid tax on RESP withdrawals. Another can help a couple pay less tax on non-registered investments. Retirees or near-retirees are shown how to claim the pension income tax credit and save tax from ages 65 to 71.

## ► MUTUAL FUND INVESTING

### Can market timing work?

**Every once in a while, historically, a robust stock market suffers a correction or even a crash and then recovers – sometimes quickly, other times over a longer period. We’ve even experienced such market swings fairly recently.**

Some mutual fund investors may wonder if such a situation presents an opportunity to sell high and buy low. In theory, you should profit considerably if you sell investments at or near a market peak and reinvest when the market bottoms out.

That is correct in theory, but it’s another story in practice.

#### **Predicting the market is risky**

You cannot predict, with any consistency, when the market has peaked and is due to fall. Say the market hits a record high, and an investor who is attempting to time the market sells a large proportion of their equity fund investments. What happens if the market continues to climb? Not only would the investor miss out on the gains, but they would need to reinvest when prices are higher.

That risk is real. Historically, record highs are often an indicator of continued market

growth, not necessarily a signal of a market due for a correction. A good example is this year’s performance of Canada’s S&P/TSX Composite Index, which has recorded multiple record highs in 2025.

Even if a market timer gets lucky and the market plummets after they sell, they can still miss out. To succeed at timing the market, you must guess correctly twice – when to sell mutual fund investments and when to buy back in. While you’re waiting for an ideal time to reinvest, the market could rebound quickly.

#### **Investing regularly pays off**

By investing on a regular basis, you benefit without having to anticipate the market’s direction. When markets are down, you purchase more fund units at lower prices. In rising markets, you participate in the growth without overinvesting when prices are higher. ◀

# How to make tax-efficient RESP withdrawals

When it comes to withdrawing funds, your Registered Education Savings Plan (RESP) is different from any other registered plan. It's all because an RESP is composed of two pools of mutual funds – one pool is taxable, and the other is non-taxable.

Your original contributions make up the non-taxable pool. This pool is your money. You can withdraw funds from this pool at any time, in any amount and for any purpose.

The taxable pool consists of Canada Education Savings Grant (CESG) funds, any provincial grant funds and plan earnings. Withdrawals from this pool are called Educational Assistance Payments (EAPs), and the amounts are taxable to your child as income while they're a student.

You choose the pool, or pools, for each mutual fund withdrawal.

## Withdrawals of contributions

You can withdraw your original contribution amounts tax-free at any time, without limits on withdrawal amounts.

## Educational Assistance Payments (EAPs)

Withdrawals from a pool of grant funds and plan earnings are taxable to the student.

## Withdrawal strategies

Over the years of your child's post-secondary education, you have two goals when withdrawing funds from your RESP. First, you want to minimize or potentially avoid having your child pay tax on withdrawals. Second, you want to completely use up the taxable pool that includes grant money and plan earnings. Should funds remain in the taxable pool after your child graduates, you must repay the remaining grant money to the government if you close the plan.

**When annual income is low.** Your child can have an annual income up to the basic personal amount (\$16,129 for 2025) plus the amount of their tuition tax credit without owing tax. In years when your child's income is lower, you have the opportunity to make larger

withdrawals of EAPs and remain under the taxable threshold. Some students never have to pay tax on RESP withdrawals.

**When annual income is higher.** Your child could have a year when they owe tax on earned income if they have a well-paying spring and summer job, a paid internship or a co-op work term. By taking withdrawals of contributions, they won't also have to pay tax on their RESP withdrawals. However, keep in mind that you want to eventually take enough EAPs to use up the taxable pool of funds.

**When education costs are lower.** In some cases, education costs end up being lower than you expected. Maybe you budgeted for your child moving away for school, but they chose a local university and live at home. Or you saved for four years of a university program, and your child enrolls in a two-year college program. In this case, your primary goal is not saving tax on withdrawals – it's to deplete the pool of grant money and plan earnings. Paying tax on withdrawals at your child's tax rate is better than possibly forfeiting the grant money. ◀

## Mutual funds in the final phase

**In earlier school years, one child's RESP can vary greatly from another's. Parents with a higher risk tolerance may favour equity funds, while conservative investors will favour fixed-income funds.**

But all that changes by the time students reach the end of secondary school. Now, typically, RESPs are very much alike, holding only – or almost only – fixed-income and cash-equivalent mutual funds. Investing in equity funds is risky at this stage. If there's a significant market downturn,

your equity investments may not recover before you need to withdraw the funds.

However, risk tolerance does play a minor role in the final phase, when the child is a post-secondary student. A conservative RESP-holder may only invest in money market or high-interest savings mutual funds. Someone with a higher risk tolerance might also invest in bond funds, often short-term bond or government bond funds, especially in the first year or two of the student's post-secondary education. ◀

## Investing in the retirement risk zone

**The zone begins several years before you plan to retire and lasts until several years after you retire, and the risk is the market suffering a significant downturn during this critical period.**

What if someone is a year from retiring, a market crash erases 20% of their savings, and they feel they have to postpone their retirement? Or what if a recent retiree faces a plummeting market and is forced to draw income from investments that have lost value?

Fortunately, several strategies exist to help safeguard your mutual fund savings in the retirement risk zone. The solution is personal – what works for one investor may be different for another. A variety of factors determine which strategy suits your situation, including your retirement income sources, risk tolerance, net worth, marital status, desired retirement lifestyle and estate plans.

### Shifting asset allocation

One strategy is to increase a portfolio's fixed-income investments while decreasing equity investments in the period before

retirement. The shift happens gradually over several years to reduce the risk of selling a substantial portion of equities in a down market. An individual can also help make the transition by only investing in fixed-income mutual funds during the years leading up to retirement.

This strategy serves to illustrate why the solution is personal. Shifting asset allocation may suit a conservative investor who will have a workplace pension to help provide retirement income. However, this fixed-income-based strategy might not suit a more risk-tolerant investor who is counting on investment growth to help fund a hopefully long retirement.

### Building a cash reserve

Another strategy is to create a reserve of money market funds or low-risk fixed-income funds in the years before you retire. This way, if the market suffers a correction or crash during the initial years of your retirement, you can use the reserve to provide income while you give the market a chance to recover. The cash reserve, also called a cash wedge, typically covers your cost of living for a couple of years or more,

and some retirees choose to replenish the reserve throughout retirement.

Other strategies are available to help you navigate the retirement risk zone. When retirement approaches, we'll work with you to determine which solution suits your financial situation and gives you peace of mind. ◀

## When your parents may need your help

**As your parents age, they may need assistance getting groceries or taking care of the house, but they might also need help with their financial life.**

Here are some important financial and wealth planning matters you may want to find out about. Talking to parents about their finances isn't always easy, but managing any potential issues now is better than waiting until a problem arises.

**Are their wills up to date?** Some people go a great many years, even a couple of decades, without reviewing their will. While looking over their will, your parents should ensure they're still content with their choice of primary and alternate executors (personal representative, liquidator or estate trustee, depending on the province).<sup>1</sup>

**Find out about the power of attorney.** Ask your parents if they have a power of attorney for financial affairs, known as a mandate in Quebec, should they become

unable to manage their finances. Some people believe their spouse or child can fulfill this role without making a power of attorney, but in that case, a family member must apply to the courts for guardianship.<sup>1</sup>

**Can they cover health care costs?** Though this topic may be difficult to address, it's helpful to know whether your parents can afford private health care if that support becomes necessary to continue living at home.

**Warn your parents about fraud.** Scammers commonly target seniors. Have your parents be wary of any request for money or personal identification made by mail, email, phone, online or at the door. Emphasize that fraudsters can appear to be legitimate — for example, claiming to be a representative of the Canada Revenue Agency (CRA). ◀

<sup>1</sup> We recommend having your parents contact their legal counsel for more information.

## Have the lower-income spouse invest

**If you and your spouse are in different tax brackets, here's an easy and highly effective way to save tax on income and growth of non-registered mutual fund investments.**

The lower-income spouse has less income available to invest, especially when both spouses cover household expenses. With this strategy, the higher-income spouse pays all the couple's or family's household expenses and their spouse's personal expenses. Now the lower-income spouse has more money to invest. When they invest these freed-up amounts in a non-registered account, the mutual fund investments are taxable at the lower-income spouse's more favourable tax rate.

To make this method even more effective, the higher-income spouse can pay their spouse's income tax owing – freeing up more money for the lower-income spouse to invest.

With this strategy, you and your spouse may want to keep separate bank and investment accounts, in case the Canada Revenue Agency (CRA) wants to know about the lower-income spouse's ability to invest. ◀

## Using the principal residence exemption

**Many Canadians' largest tax break is not having to pay tax on the capital gain when they sell their home, thanks to the principal residence exemption. Here are three questions that come up.**

Can you claim the principal residence exemption more than once? Yes, you can claim one principal residence per calendar year, even when you sell your second, third or subsequent home.

**What's the criteria for claiming a vacation property?** Some vacation property owners want to designate the property as their principal residence for years when it had a larger capital gain than their home. Though the term is "principal" residence, an eligible property only has to be "ordinarily inhabited in the year" by the owner or the owner's spouse or child. Just living in the cottage, cabin or chalet for a short period qualifies.

**What are the reporting rules?** You report the sale of your principal residence when you file your tax return for the year you sell the property. You designate the property on Schedule 3, "Capital Gains or Losses" and complete Form T2091 (IND), "Designation of a Property as a Principal Residence by an Individual."

For more information on the principal residence exemption, please talk to your tax professional. ◀

## The mini-RRIF strategy

**The latest age to convert a Registered Retirement Savings Plan (RRSP) to a Registered Retirement Income Fund (RRIF) is 71, but you may want to open a RRIF at 65.**

You can take advantage of a strategy that saves you tax each year from ages 65 through 71. It's based on the federal pension income tax credit, which allows you to claim 15% on \$2,000 of eligible pension income. A provincial pension income tax credit is also available (except in Quebec), with the percentage varying by province.

Here's how it works. At age 65, you open a RRIF and transfer \$14,000 from your RRSP to your RRIF, still invested in mutual funds. From ages 65 to 71, you withdraw \$2,000 annually from your RRIF, claiming the pension income credit each year. If you don't need the \$2,000 RRIF withdrawals as income, you could invest the money in mutual funds in your Tax-Free Savings Account (TFSA) or a non-registered account.

From age 72 onward, you can continue to claim the annual tax credit on the first \$2,000 of your RRIF withdrawals. ◀
